

# **Comedy of Errors: Methadone and Buprenorphine**

Douglas Gourlay MD, MSc, FRCP(C), DFASAM

### **Disclosures**

■ Nothing to disclosure

Painweek.

# **Learning Objectives**

- Explain the pharmacology of methadone and buprenorphine
- Describe methadone and buprenorphine in a case-based model focusing on analgesic conversion

3

#### Methadone

- Potent, synthetic µ analgesic, NMDA antagonist
  - -Racemic mixture of R- and S-enantiomers
  - -Analgesia is largely due to R-enantiomer; S-enantiomer is predominantly NMDA antagonist
- Highly variable elimination t<sub>1/2</sub> 14-40hr (or more)
  - -No active metabolites
  - -Makes conversion challenging
  - -Accumulation is it's strength and liability
- Hepatic metabolism largely CYP450 3A4
- QTc prolongation

#### **Methadone Clinical Pearls**

- Methadone has no sense of humor!
  - -Mistakes made here are often fatal
- "Start Low Go Slow"
- The reason to use methadone should not simply be cost or an insurance directive
  - -If you want/need to use this drug, get an experienced mentor to work with you until you are sufficiently experienced

5

# Methadone Kills One of 3 Ways

- Single overdose
  - -Many methadone initiation protocols recommend total starting dose to be 15-30mg/day (in divided doses for pain)
    - Rational is that the limited literature describing methadone overdose has been in excess of 40mg/day, even in opioid naïve patient
  - -Lethal dose for children is much lower

## Methadone Kills One of 3 Ways (cont'd)

- Accumulated toxicity
  - -"Today's dose isn't lethal; tomorrow's dose isn't lethal but all the 3<sup>rd</sup> days' dose PLUS ½ the 2<sup>nd</sup> days total dose PLUS ¼ of the 1<sup>st</sup> days dose *accumulates* to a fatal dose"
  - -The most lethal period in methadone treatment is the first 7-10 days (induction phase)
    - · Over zealous dose increases are a big risk

7

# Methadone Kills One of 3 Ways (cont'd)

- Accumulated toxicity (cont'd)
  - -No dose increases until after the first 3 days
    - $\bullet$  Assuming a drug  $t_{1/2}$  of 24 hrs, patient has achieved 87.5% of steady state after the  $3^{rd}$  day
      - -If sedation isn't a problem at this point, unlikely that a cautious dose increase will result in sedation d/t accumulated toxicity
  - After initiation phase is over, dose should be increased no more frequently than q7-10days

# Methadone Kills One of 3 Ways (cont'd)

- Drug-drug interactions
  - -"methadone dose isn't fatal the benzodiazepine by itself isn't fatal; but the 2 drugs together lead to a fatal outcome"
  - -Most commonly seen with combinations of sedatives PLUS methadone
    - BUT drug metabolism can also pose significant risks

9

## **Drug Metabolism**

- Rapid metabolizers—GENETIC
  - -Tend to need more total drug and doses more frequently
    - Some people simply metabolize through the relevant CYP 450 pathways leading to a significantly lower drug half-life than 24hrs
- Poor metabolizers—GENETIC
  - -Dose lasts longer
    - · Total daily dose tends to be lower

# Drug Metabolism—latrogenic

- While genetic variations tend to be fixed, CYP 450 active drugs can temporarily alter these pathways changing a normal metabolizer into a rapid or even poor metabolizer
  - -CYP 450 inducer-eg, phenytoin
  - -CYP 450 inhibitor—eg, macrolide antibiotics

11

# **Methadone Case Example**

- ■65 yo woman on methadone 5 mg q8h
  - -Dx post herpetic neuralgia
    - · Also on carbamazepine for her neuropathic pain
  - -Patient has been stable, with good pain control but bothered by carbamazepine s/e
    - · Decision is made to switch to gabapentin
- Patients husband calls after 5 days to complain his wife is somnolent; difficult to rouse

# What's Happened?

- Patient was on a stable dose of methadone, beyond the first 2 weeks of high risk initiation BUT
  - -A potent 3A4 inducer was discontinued
    - Gabapentin does NOT affect 3A4 pathway
  - -So, in effect, the patient has had a significant effective increase in her methadone dose because she no longer rapidly metabolizes methadone

13

#### **Methadone Conversion**

- Several things to consider
  - -Is the patient on lower dose morphine (<300mg/day MME)</p>
    - Methadone : morphine ~1:10 but varies!
  - -Do you want fast or slower conversion
    - UK protocol vs Edmonton protocol
  - -Any concurrent disorders ie substance use?
    - · Age; resp illness etc

#### **Edmonton Protocol**

- General principles
  - -Calculate approximate daily methadone equivalency
    - Highly variable—many tables online
  - -Incur "opioid debt" ie reduce first opioid by 20% (for a 5 day rotation cycle)
  - –Add methadone in divided dose (bid/tid)
    - Titrating upward as first opioid is reduced
  - -By day 5, off first opioid—titrate methadone according to best practices

# **Buprenorphine**

The Versatile Molecule

#### Consider the Case of Mr. Black

- 65 year old former bank chairman with longstanding history of painful, burning legs
  - -Dx peripheral neuropathy due to poorly controlled diabetes
  - -Reason for referral is to assess current opioid use
  - -Patient states "I just can't seem to come off these Percocet®"
    - · Current pain medications:
      - -Oxycodone/APAP 5/325 "up to 10 per day"
      - -Pregabalin 75mg twice daily
      - -Duloxetine 30mg twice daily

17

## Mr. Black (cont'd)

- •According to the referral note, Mr Black has improved significantly since the addition of pregabalin/duloxetine however.... 'he hasn't been able to stop his use of oxycodone'
  - -"I've tried to stop my Percs but each time, my pain gets much worse"
    - Past medication regimen includes controlled release oxycodone 80mg 'up to 4 times per day' (total of 320mg/day) with oxycodone immediate release 10mg 'maximum of 10 per day'

#### So, back to the case...

- •Mr Black's risk assessment was deemed to be:
  - -"LOW"
- His worsening pain on discontinuing IR opioids
  - Not evidence of ongoing opioid responsive pain but rather withdrawal mediated pain
  - His multiple failed attempts at stopping use of IR oxycodone suggested a new strategy was necessary
  - -What about buprenorphine in this situation?
    - What will it's role actually be?

19

## **Buprenorphine**

- ■Developed in 1966 by Reckitt & Coleman in Hull, England
  - –John Lewis, doctoral student under Sir Robert Robinson (identified the structure of morphine in 1925)
  - Pharmacologic profile disclosed in 1972 at
    College on Problems of Drug Dependency annual meeting
  - Developed as a 'safe, effective analgesic with very little physical dependence'
  - -Marketed as an injectable in very low doses (ie, 0.4mg/ml)

## **Brief Overview: What We Thought**

- Buprenorphine is a semisynthetic partial μ agonist (and κ antagonist)
  - -Initially used as analgesic; now 1° maintenance agonist therapy (MAT)
  - -Linear  $\mu$  effect at lower doses
  - -Morphine equivalency of ~40:1 over linear range
  - -Improved safety profile due to "ceiling effect"
  - -Available as SL mono/naloxone-combo tablet for DATA 2000

21

# **Pharmacology**

- Derived from opium alkaloid thebain
- Terminal elimination t½ ~24-60 hours but:
  - -Analgesic duration of action is ~6-8 hrs
  - -MAT duration of action is ~24-48 hrs
- Poor oral bioavailability but well absorbed by sublingual/parenteral/transdermal route
- CYP 450 3A4 (lesser 2C8) metabolism through N-dealkylation (like methadone)

# Pharmacology (cont'd)

- Very high receptor affinity
  - -Once attached, remains until the receptor is recycled
  - -Less than complete receptor occupancy needed to effect MAT action
  - -Can precipitate withdrawal in full μ dependent users
    - $\bullet$  But can always add full  $\mu$  agonist to patient on buprenorphine without fear of inducing withdrawal

23

## **Buprenorphine Redux**

- The partial µ agonist role is under review\*
  - -Evidence suggests that the molecule may be a full agonist in the role of analgesic
    - While being a partial agonist in terms of respiratory depression
- Buprenorphine is thought to have antinociceptive effects through ORL-1 receptors°
  - -ORL-1 may play a role in apparent ceiling effect of the drug
- Buprenorphine is complicated!

\*Pergolizzi et al, Pain Practice 2010 10(5):428-450

°Lutfy and Cowan, Curr Neuropharm 2004 2(4): 395-402

## **Buprenorphine Available Forms**

- Buprenorphine was available only as an injectable
- More recently, as sublingual and transdermal formulations
  - -Buprenorphine 'mono-product'
    - SL tablets of buprenorphine HCl
  - -Buprenorphine 'combination-product'
    - SL tablets of buprenorphine HCl/naloxone 4:1
  - -Buprenorphine transdermal system
    - 7 day matrix patch (5, 10, 20µ/hr)
    - 4 day matrix patch (35, 52.5, 70µ/hr)
  - -Buprenorphine trans-buccal q12h dosing

25

# **Conversion From High-Dose Full-Opioid Agonists to Sublingual Buprenorphine**

- 2 papers outline the use of SL buprenorphine conversion in physically dependent pain patients – both were observational reports based on retrospective chart analysis
  - -Jonathan Daitch et al Pain Physician 2012 15:ES59-66
  - -Jonathan Daitch et al Pain Medicine 2014 15(12); 2087-2094

#### **Conversion of Chronic Pain Patients**

- Results show a significant decrease in pain scores and in the second study, improvements in quality of life
  - Overall decrease of 51% in pain scores before/after conversion with no statistical difference between initial pain ratings of 0-7 vs 8-10
  - −QoL improved from 6.1 before conversion to 7.1 (P=0.005)
    - As well, the greater QoL improvements were seen in those converting from the higher doses of opioids
  - -Average dose of buprenorphine SL was 28.11±5.94mg

27

#### Back to Mr. Black

- •Might he be a candidate for conversion to buprenorphine?
  - -If yes, in what capacity?
    - Opioid rotation?
      - -At what dose conversion?
    - Opioid maintenance?
      - -At what daily dose?
    - Opioid withdrawal management?
      - -At what dose?

#### Mr. Black

- After thorough discussion about risks (especially of ongoing maintenance with buprenorphine) and benefits
  - -Patient was advised to reduce his immediate release oxycodone by 50% at which point a 5μ/hr TDS-buprenorphine was applied
    - He was encouraged to not use his oral oxycodone but to take only if necessary
  - -Over the week, he continued to reduce his oral opioid
    - · The goal was
      - -1) Discontinue his oxycodone/acetaminophen use and
      - -2) Remain on lowest dose of TDS-Buprenorphine necessary to eliminate w/d symptoms

29

# Mr. Black (cont'd)

- On day 3, he was asked to call in to speak with our nurse regarding progress
  - -If necessary, the patch was increased to 10µ/hr after day 3
  - He was cautioned NOT to interpret a worsening of his pain symptoms as evidence of failure until he was on a steady (and optimal) dose of TDS-buprenorphine

#### Mr. Black conclusion

- Successfully discontinued oxycodone/APAP use after first week on TDS-buprenorphine
  - -Ultimately stabilized on 10µ/hr transdermal patch
  - -Elected to remain on patch; minimal side effects
    - •May decide to discontinue the patch at a later date

31

## **Final Thoughts**

- Consider using buprenorphine in low AND high dose opioid users who are unable to discontinue use through simple tapers
  - -High doses of opioids more often reflect patient tolerance NOT patient need
  - While general trends may be useful, there is no reliable way to 'estimate' ultimate stabilizing dose of drug
    - · Goal is NOT 'therapeutic equivalency', the goal is opioid stability

## **Buprenorphine Metabolism**

- Certainly, CYP450 3A4 induction/inhibition can affect serum levels of parent, BUT
  - -Serum levels of drug have a much less direct impact on therapeutic effects
    - Compared with methadone serum level goes up CNS levels go up and receptor occupancy goes up levels go down, receptor occupancy goes down
  - -But buprenorphine receptor dissociation is so slow, effect is less dramatic

33

## **Acute Pain Management**

- Can you add full agonists to patients chronically using partial agonists?
  Will you ppt w/d? NO, NEVER
- Should you *chronically* use full agonists *with* patients on partial µ agonists? -NO – generally not
- Are full agonists effective with patient's on buprenorphine? YES
