

Learning Objectives

- Describe the clinical utility and limitations of key imaging studies for the differential diagnosis of pain pathologies.
- Identify how reliance upon such studies alone can adversely influence the outcome of patient treatment.
- Explain strategies to enhance the clinical yield of pain diagnostic studies.

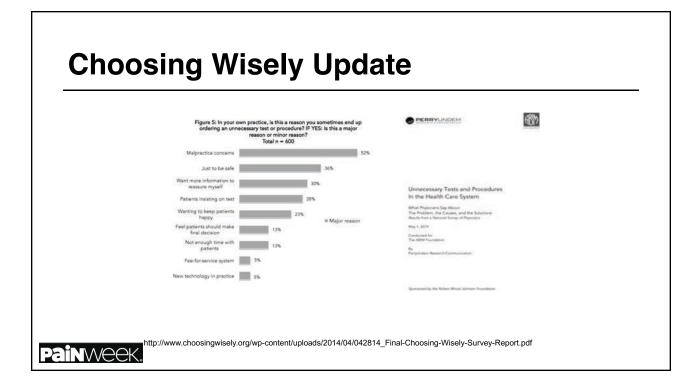

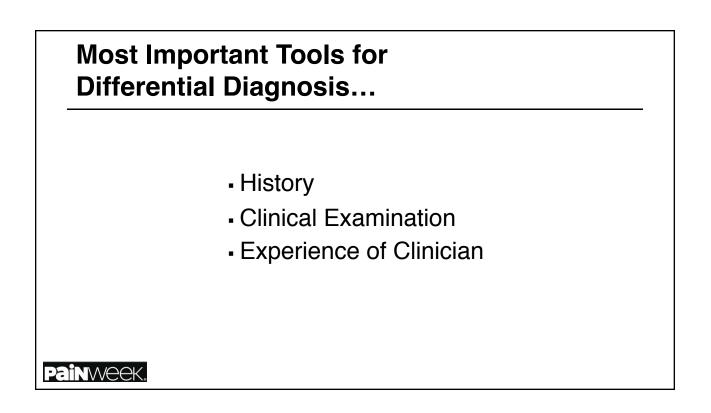

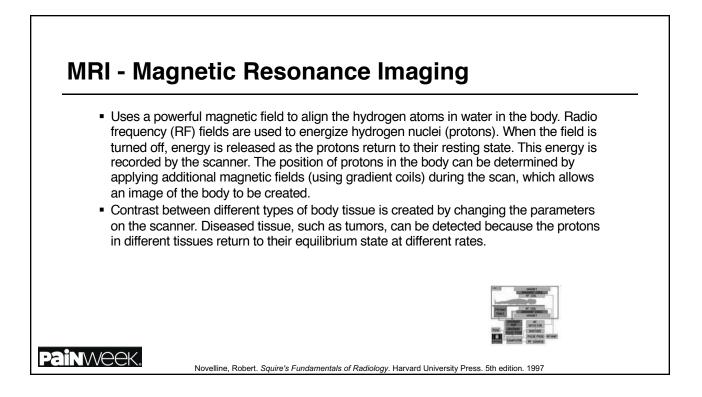

Choosing Wisely Update	
	 72 Societies and 17 community groups have joined the initiative.
	Over 450 recommendations (over 66 lists).
	 Hundreds of potentially unnecessary medical tests and treatments have been identified to date. Several societies have released 2nd and 3rd lists.
	 Estimated 5 billion in potential savings for unnecessary testing.
	400 Main stream articles/20,000 blogs or Pt stories about unnecessary tests or treatments.

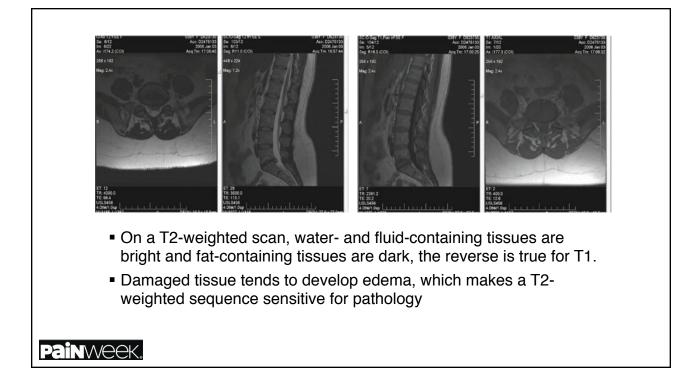

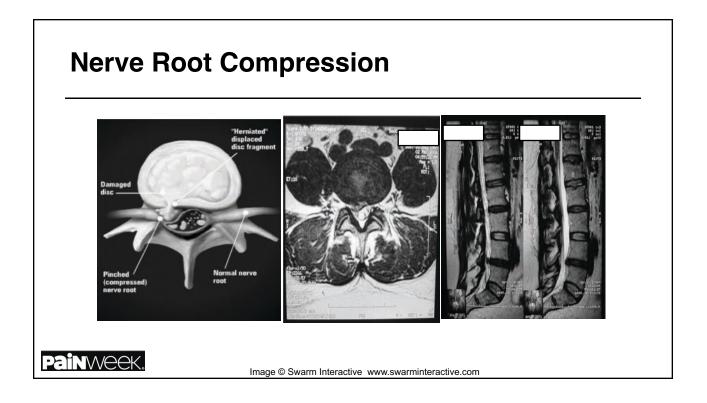

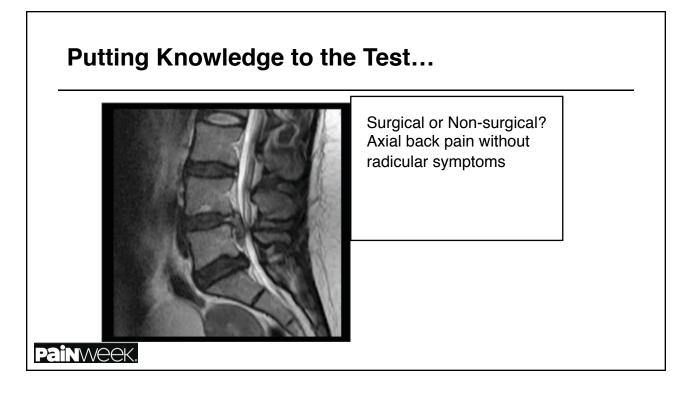

Adverse Factors Affecting Physical Diagnosis

- Limitations of Time
 - Volume of patients may limit face-to-face time with clinician.
 - Reimbursements tend to devalue clinical component.
- Reliance Upon Technology
 - MRI shows disc hernations so that must be the cause of the patient's neck pain.
- Clinical Experience
 - Has the clinician evaluated patients with similar symptoms before

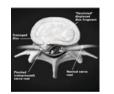

Clinical Pearl

MRI may demonstrate disc compression of a nerve, but current technology <u>*does not*</u> describe inflammation of a nerve (radiculitis).

Painweek

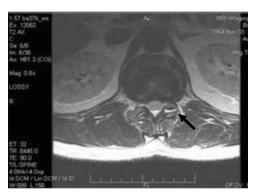

Which patient is suffering from severe chronic low back pain?

While providing valuable structural, they do not necessarily reflect whether a pathology is clinically relevant.

Clinical Pearl

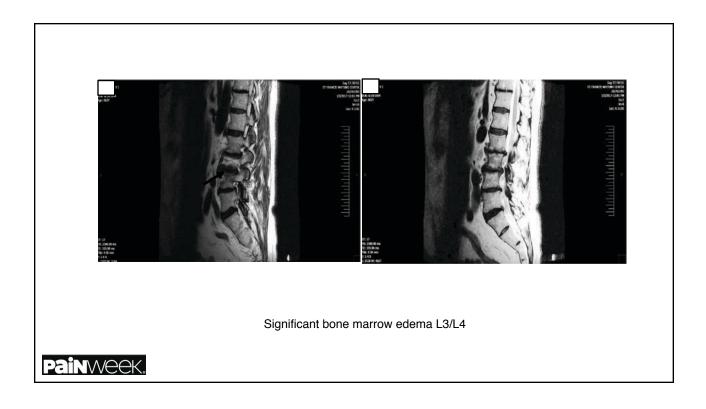

Facet joint inflammation

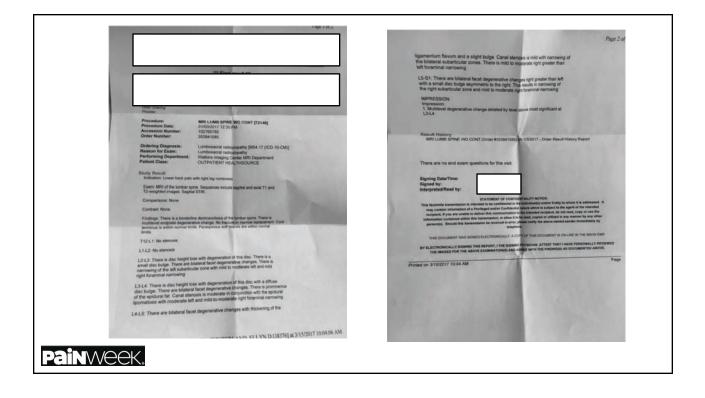

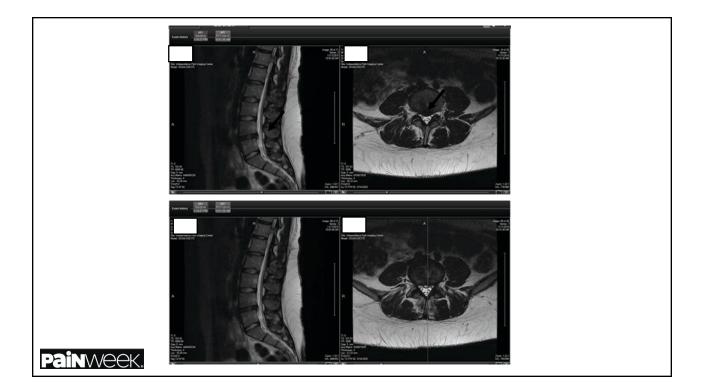

The individual reading the MRI or other imaging study is often not clinically familiar with the patient

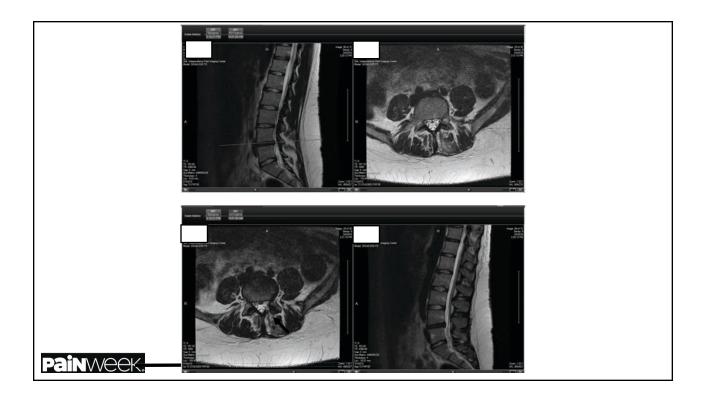

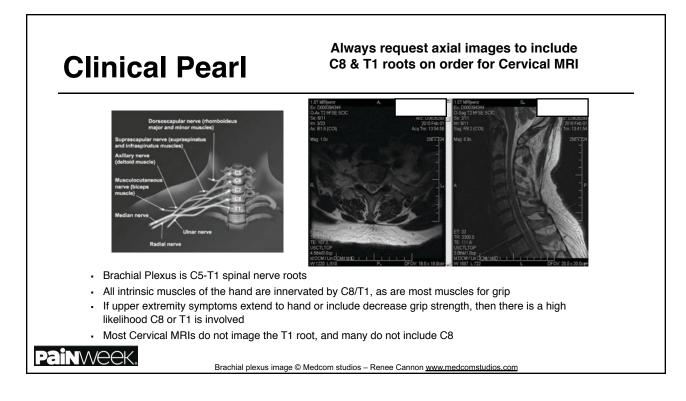

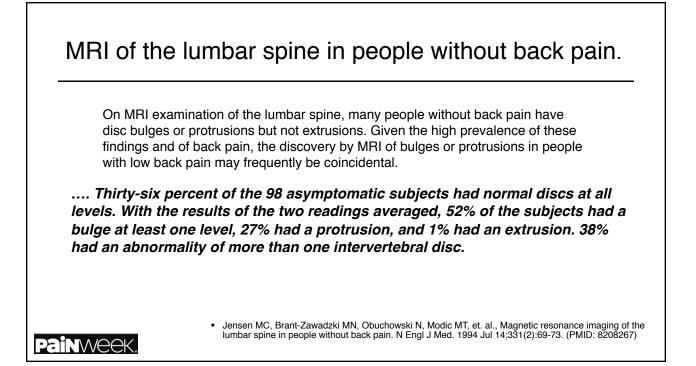

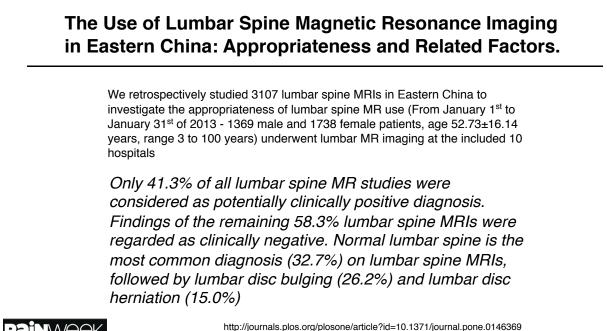

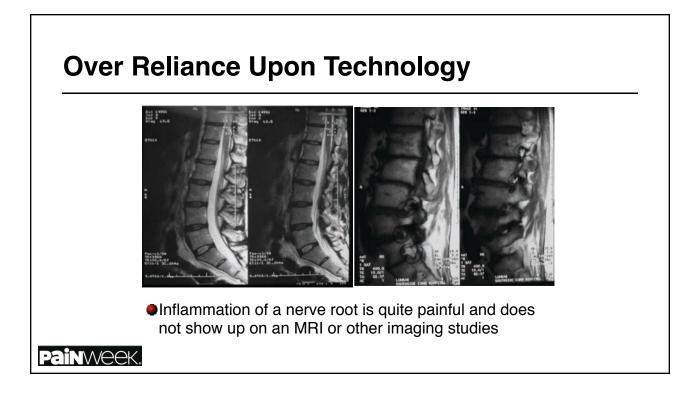

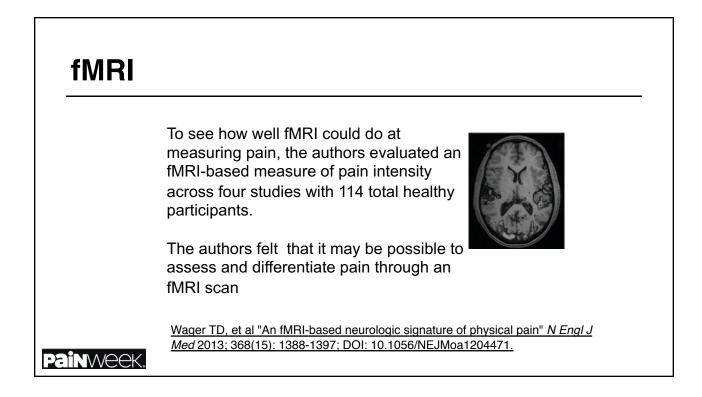

MRIs were not predictive of the development or duration of low-back pain. Individuals with the longest duration of low-back pain did not have the greatest degree of anatomical abnormality on prior scans. Clinical correlation is essential to determine the importance of abnormalities on magnetic resonance images.

.... 77 asymptomatic individuals with no history of back pain underwent magnetic resonance imaging of the lumbar spine. 21 subjects (31%) had an identifiable abnormality of a disc or of the spinal canal. In the current study, we investigated whether the findings on the scans of the lumbar spine that had been made in 1989 predicted the development of low-back pain in these asymptomatic subjects.

Borenstein DG, O'Mara JW Jr, Boden SD, Lauerman WC, et. al., The value of magnetic resonance imaging of the lumbar spine to predict low-back pain in asymptomatic subjects: a seven-year follow-up study. J Bone Joint Surg Am. 2001 Sep;83-A(9):1306-11. (PMID: 11568190)

CT - Computed Tomography

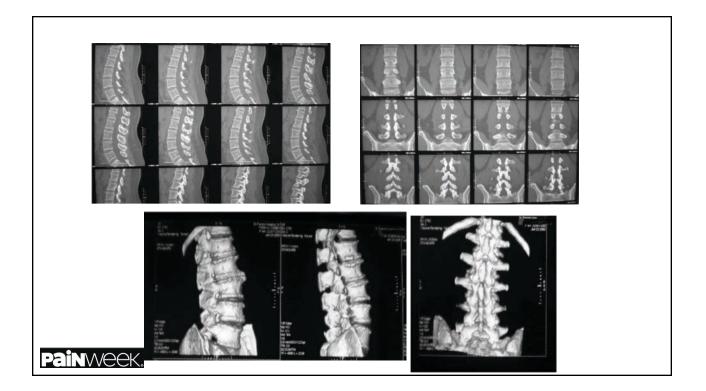

- Earlier referred to as CAT (computed axial tomography) scan, employs tomography. Digital geometry processing is used to generate a 3D image of the inside of an object from a large series of 2D x-rays images taken around a single axis of rotation.
- Has become the gold standard for diagnosis of a large number of different diseases or pathologies.

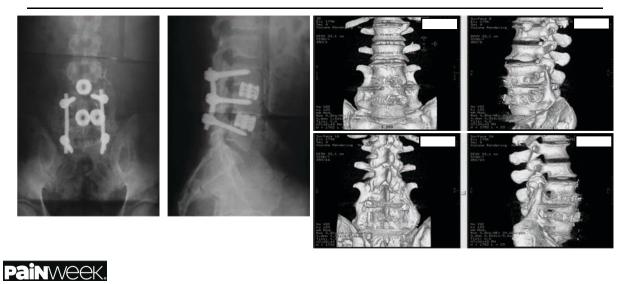

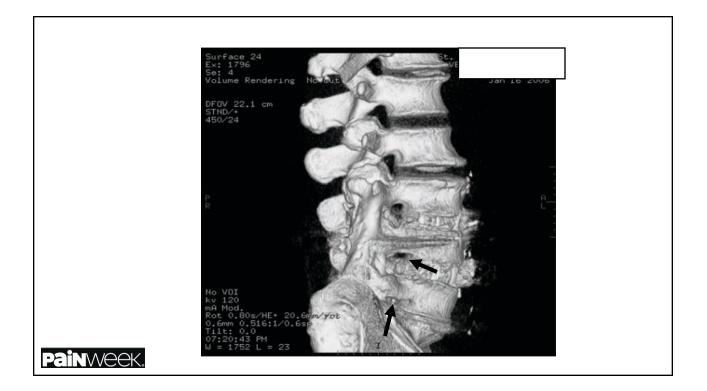

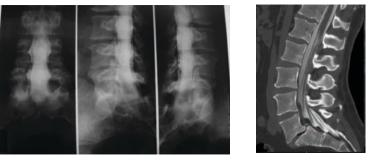

X-ray vs. CT

CT Myelogram

- Address a limitation of CT to assess neural structures in the spine by combining with Myelography (injecting radiographic contrast into the spinal canal (CSF) to help illuminate the spinal canal, cord, and nerve roots during imaging, particularly sensitive at detecting small herniations resulting in root compression.
- Often ordered by surgeons for operative planning or as a substitute for MRI imaging for patients who cannot have an MRI.

Painweek.

Bone Scan

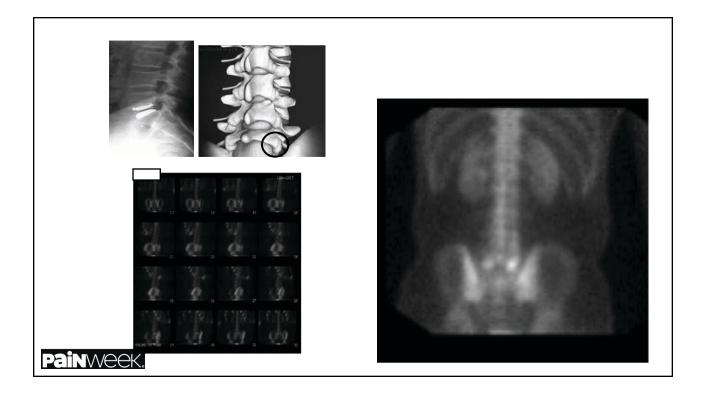

- A nuclear scanning test that can identify areas of new bone growth or destruction. It can be done to evaluate damage to the bones, find cancer that has spread (metastasized) to the bones, and monitor conditions that can affect the bones (including infection and trauma).
- A bone scan can often find a pathology days to months earlier than a regular X-ray test.

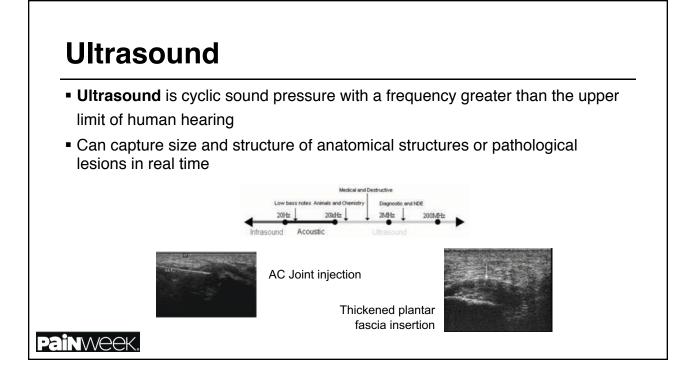

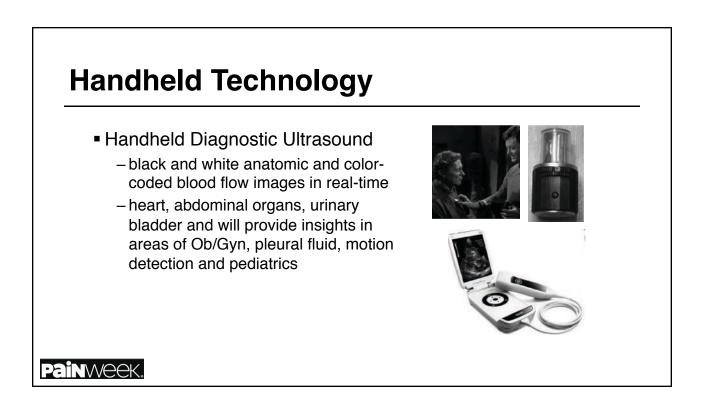

Fischbach FT, Dunning MB III, eds. <u>Manual of Laboratory and Diagnostic Tests</u>, 8th ed. Philadelphia: Lippincott Williams and Wilkins, 2009.

Bone Scan

- Radioactive trace is injected into the patient. After 2-5 hours, a gamma camera is then used to image the body.
- Abnormalities are identified by "hot spots" and "cold spots."
 - Hot accumulation of tracer caused by a fracture that is healing, bone cancer, a bone infection or a disease of abnormal bone metabolism.
 - Cold certain type of cancer (such as multiple myeloma) or bone infarction.

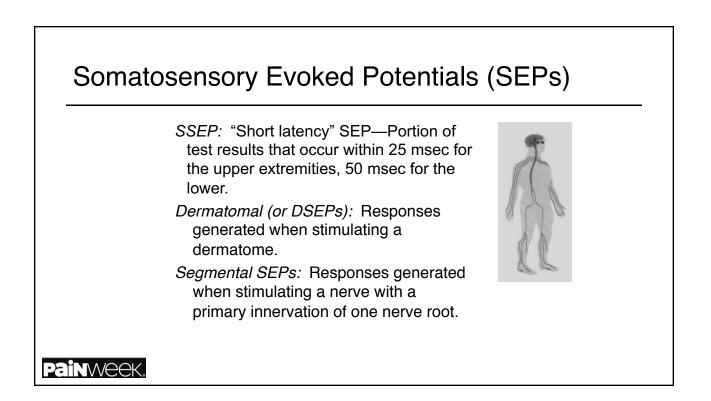

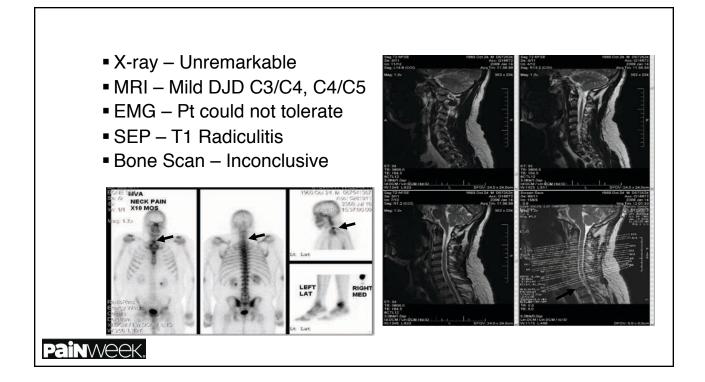

Clinical Pearls for EMG

- Pre-ganglionic sensory radiculopathies cannot be identified by classic EMG/NCV.
- Cookie-cutter studies are very limited in their ability to identify pathology by being narrowly focused. In this regard, tailoring the study to the patient can significantly increase diagnostic yield.

Delisa JA, et. al., Manual of Nerve Conduction Velocity and Clinical Neurophysiology, Raven Press, 1994.

Take Home Message

- The reliability or the clinical relevance of any diagnostic procedure is never 100%.
- The studies themselves may be deficient in that particular clinical situation.
 - Inadequately structured for that particular patient.
 - Adversely effected by other influences (technical considerations).
- Objective clinical examination findings should not be dismissed based solely upon negative test results.
